certa profondità. Leonardo concepisce uno scafandro in cuoio composto da giubbone, calzoni e maschera con occhiali di vetro. Il rigonfiamento della giubba, destinato a contenere in un otre la riserva d'aria, è sostenuto da una struttura di cerchi di ferro. Con la convinzione che questa riserva potesse durare a lungo, Leonardo prevede un sacco di pelle ermeticamente chiuso e fornito di una valvola da utilizzare per la salita o la discesa subacquea. Sono inoltre presenti sacchi di sabbia come zavorra, una lunga corda, un coltello e un corno per segnalare la fine delle operazioni.

DIVING SUIT

Already in Leonardo's time mechanisms to enable a person to work in water at a certain depth were being tested. Leonardo designs a diving suit in leather, consisting in a heavy jacket, pants and mask with glass goggles. The jacket was to be inflated in order to hold an extra air supply in a windbag, and was reinforced by iron rings. With the certainty that this air supply could last for a long while, Leonardo also provides a windbag, hermetically sealed and equipped with a valve to be utilized for returning to the surface or deep diving. There are also sandbags as weights, a long rope, a knife and a horn to signal the completion of the procedure.

BUZO

Ya en los tiempos de Leonardo se experimentaban sistemas para trabajar bajo del agua a una cierta profundidad. Leonardo dibuja un traje de buceo de cuero compuesto por un chaquetón, unos pantalones y una máscara con gafas de cristal. La hinchazón del chaquetón, destinado a contener dentro de un odre la reserva de aire, está sostenido por una estructura de círculos de hierro. Con la convicción de que esta reserva pudiera durar
